Week - 3 Day -1 (Logo and Model Change)

CONTENTS

01

Browser Extension

02

Logo change

03

Model Change

PART 01

Browser Extension

Basic info:

Browser Extension

A browser extension is a small software program that you install into your web browser (like Chrome, Safari, or Edge) to add new features or modify how websites behave

Fake Data Extension

a browser extension that automatically fills web forms with random dummy information. It instantly generates realistic fake names, emails, passwords, and phone numbers, saving developers and testers hours of manual typing

Tech stack

HTML (HyperText Markup Language): Structures the extension's user interface, such as popup menus, options pages, and custom sidebars.

CSS (Cascading Style Sheets): Styles the HTML elements to ensure the extension's interface is visually appealing and integrates cleanly with the browser.

JavaScript: The core programming language that powers the extension's logic, allowing it to interact with web pages, manage user input, and utilize browser APIs.

Manifest.json

A manifest.json file is a configuration file used in web development that acts as an app's instruction manual and ID card. It contains vital metadata (name, version, icons, permissions) in JSON format and is most commonly used for browser extensions and Progressive Web Apps

1. Logo change

Logo Change

To change the logo of the browser extension:

1. Act as a Architect and scan through the entire project code and then display me what are the files having the code giving a logo to the browser extension
2. For Approving the Code Changes switch to the Agent mode and approve it

Step 01: Enable developer mode in the Chrome extension and load the unzipped AI extension folder

Leaftaps Login

The Following Errors Occurred:
username was empty reenter
password was empty reenter

Username

Password

[Login](#)

Step 02: Open the folder in the VS code and use the ASK and AGENT using prompts to change the logo

Changes: from hush.png to large-small.png

The screenshot shows the Visual Studio Code (VS Code) interface with the 'ai-extension' folder open. The Explorer sidebar on the left displays the file structure, including 'assets/images' containing 'hush.png', 'logo-small.png', and 'qeagle-small.png'. The main editor area shows the 'manifest.json' file being edited. The JSON content is as follows:

```
{
  "manifest_version": 3,
  "name": "AI Browser Extension for Code Generation",
  "version": "1.0",
  "description": "Test automation code generator",
  "permissions": [
    "storage",
    "activeTab",
    "scripting",
    "tabs",
    "sidePanel"
  ],
  "host_permissions": [
    "<all_urls>"
  ],
  "action": {
    "default_title": "Extension for AI Code Generation",
    "default_icon": {
      "16": "assets/images/logo-small.png",
      "32": "assets/images/logo-small.png",
      "48": "assets/images/logo-small.png",
      "128": "assets/images/logo-small.png"
    }
  },
  "icons": {
    "16": "assets/images/logo-small.png",
    "32": "assets/images/logo-small.png",
    "48": "assets/images/logo-small.png",
    "128": "assets/images/logo-small.png"
  }
}
```

The right sidebar shows the 'CHAT' and 'SESSIONS' panels. A session titled 'Browser extension logo code files' is listed as 'Failed' from 24 mins ago. A tip at the bottom right suggests using the 'Plan agent' for research and planning before implementing changes. The status bar at the bottom indicates the current position is Line 31, Column 41, with 4 spaces, UTF-8 encoding, and LF line endings.

2. Model change

Model Change

To change the logo of the browser extension:

1. Ask the Co-pilot in the Ask Mode:
I want to add another model for the groq LLM in the settings tab. Show me the impacted files
2. For Approving the Code Changes switch to the Agent mode and approve it

Step 02: Open the folder in the VS code and use the ASK and AGENT using prompts to change the model

Changes: from Llama-3.3-70b-versatile to openai/gpt-oss-120b

The screenshot shows the VS Code editor with the file `popup.js` open. The code defines a function `updateModelOptions(provider)` that updates the model selection list in the settings UI. The `openai` provider list is updated to include the new model `openai/gpt-oss-120b`.

```
document.addEventListener('DOMContentLoaded', async () => {  
  // Model options by provider  
  const modelsByProvider = {  
    groq: [  
      { value: 'deepseek-r1-distill-llama-70b', label: 'deepseek-r1-distill-llama-70b' },  
      { value: 'llama-3.3-70b-versatile', label: 'llama-3.3-70b-versatile' }  
    ],  
    openai: [  
      { value: 'gpt-4o', label: 'GPT-4o' },  
      { value: 'gpt-4o-mini', label: 'GPT-4o Mini' },  
      { value: 'openai/gpt-oss-120b', label: 'openai/gpt-oss-120b' }  
    ]  
  };  
  
  // Function to update model options based on selected provider  
  function updateModelOptions(provider) {  
    modelSelect.innerHTML = '<option value="" disabled selected>Select a model';  
  
    if (provider) {  
      modelSelect.disabled = false;  
      const models = modelsByProvider[provider] || [];  
      models.forEach(model => {  
        const option = document.createElement('option');  
        option.value = model.value;  
        option.label = model.label;  
        modelSelect.appendChild(option);  
      });  
    }  
  }  
  
  updateModelOptions(selectedProvider);  
});
```

The right sidebar shows the Chat interface with a prompt `ADD MODEL FOR GROQ LLM` and a response from the AI agent. The response states: "Found the settings UI and model storage logic; now confirming the exact option list and where to add the new Groq model." and "Updating the model selection list in the settings UI code; the impacted file is `popup.js`." The chat also shows a confirmation: "Added `openai/gpt-oss-120b` to the existing OpenAI model list." and a note: "If you also want the model to appear only when `Groq` is selected, I can update the `groq` list instead."

—

Thank you
